

Step-by-step procedure to create a new environment using Anaconda Prompt and run a Streamlit file for your end-to-end machine learning project

1. Open Anaconda Prompt

1. Click Start Menu
2. Search Anaconda Prompt
3. Open it

You will see something like: (base) C:\Users\YourName>

2. Create a New Environment

Use conda create command.

For example, if you want to select environment name as **myenv** then type

```
conda create -n myenv python=3.10
```

Press Enter

After a long time when asked on screen y / n , then type: y to confirm installation.

3. Activate the Environment

```
conda activate myenv
```

Now the prompt will change to: (myenv) C:\Users\YourName>

This means the environment is active.

4. Navigate to Your Project Folder using Path

Use cd command

Example: cd Desktop

or

```
cd Desktop\ML_Project
```

Make sure python file including Streamlit code for example, “app.py” is inside this folder.

5. Install Required Libraries

Install packages needed for your ML project as stated below. Copy and paste,
pip install streamlit pandas numpy scikit-learn matplotlib seaborn

6. Run the Streamlit App

Execute: streamlit run app.py

7. Streamlit Server Starts

Terminal will show:

Local URL: <http://localhost:8501>

Network URL: http://192.xxx.x.x:8501

Open the Local URL in your browser, Your ML Web App UI will appear.

8. Stop the App

Press: CTRL + C in Anaconda Prompt

Example Full Command Flow

```
conda create -n myenv python=3.10
```

```
conda activate myenv
```

```
cd Desktop\ML_Project
```

```
pip install streamlit pandas numpy scikit-learn matplotlib seaborn
```

```
streamlit run app.py
```

Step-by-Step Procedure to Generate app.py Using ChatGPT

Step 1 — Open ChatGPT

Go to: ChatGPT

Step 2 — Ask ChatGPT to Generate a Streamlit App

Copy and paste this prompt:

Create a simple Streamlit machine learning app in Python.

Requirements:

- Use Python
- Use Streamlit
- Create a title
- Add a text input
- Display the entered text
- Save code in app.py
- Give complete code

Step 3 — ChatGPT Generates the Code

You will get code similar to this:

```
import streamlit as st

# Title
st.title("Simple Streamlit App")

# User Input
name = st.text_input("Enter your name")

# Display Output
if name:
    st.write("Hello,", name)
```

Step 4 — Open Your Project Folder

Example: Desktop\ML_Project

Step 5 — Create app.py

Inside your project folder:

1. Right-click
2. Select:
 - New → Text Document
3. Rename file:

app.py

Important:

- Remove .txt
- Final name must be exactly:

app.py

Step 6 — Paste the Generated Code

Open app.py

Paste the ChatGPT-generated code.

Save the file using:

CTRL + S

Step 7 — Open Anaconda Prompt

Open:

Anaconda Prompt

Step 8 — Activate Environment

conda activate myenv

Step 9 — Go to Project Folder

Example: cd Desktop\ML_Project

Step 10 — Install Streamlit

`pip install streamlit`

Step 11 — Run the App

`streamlit run app.py`

Step 12 — Open Browser

Terminal will show something like:

Local URL: `http://localhost:8501`

Open it in browser.

Your web app will appear.

Example Output

The app will show: A title, Input box, Greeting message

Example:

Enter your name: John

Hello, John

Full Command Flow

`conda create -n myenv python=3.10`

`conda activate myenv`

`cd Desktop\ML_Project`

`pip install streamlit`

`streamlit run app.py`
